SUNGAI WATCH WASTE BREAKDOWN

WHAT HAPPENS TO THE WASTE?

All of our barriers are cleaned and maintained by our patrol team every day. The collected trash is then brought to one of our sorting facilities.

Step 1: Weigh the collected trash and sort every piece of trash into 30+ different categories

Step 2: Analyze and record data to fuel conversations around plastic pollution with stakeholders

Step 3: Wash, shred and prepare trash for up-cycling

Step 4: We believe every waste category we collect has value. The most valuable plastics are sent to our aggregator partners for recycling and we are experimenting with non-valuable plastics in our research lab to produce high quality plastic sheets made from plastic bags and plastic cups.

SUMMARY UPDATE

This quarter, we expanded our mission with the inauguration of two new village model stations in Beraban, Tabanan with Karmagawa, and in the north of Bali, near Singaraja with Marriott each targeting to intercept an additional 100,000 kilograms of plastic.

One key highlight was the transformation of a once-illegal landfill into a flourishing community garden. We marked this remarkable transition by planting 1,600 sunflowers on Earth Day, a vivid demonstration of regeneration and resilience.

Our cleanup efforts remained strong with 94 missions conducted this quarter. Looking forward, we are excited to expand our impact into East Java with more advocacy work and the introduction of a second village model this summer with Solgaard.

Thank you to everyone contributing to this incredible impact. Together, we continue to make strides towards a healthier, plastic-free planet.

Thank you for your
continuous support
and for helping us
clean Indonesia's
rivers!
